

# EFFICIENT MATRIX MULTIPLICATION USING HARDWARE INTRINSICS AND PARALLELISM WITH C#

Nikolay Pavlov

**Abstract.** In this paper we improve the efficiency of the simple matrix-multiplication algorithm using parallelism and hardware intrinsics with C# and .Net Task Parallel Library. We demonstrate how additional processing can result the overall shorter execution times. We present an algorithm in C# that achieves up to five times performance improvement on midrange hardware, using single-instruction-multiple-data instructions and unsafe code for direct access to memory where other techniques are not possible in the .Net managed environment.

**Key words:** matrix multiplication, hardware intrinsics, parallelism, simd, multi-threading, .net.
